

Perfect 🗨️ — that means your **Deliveries page is now live and fully connected** to the backend!

✅ You now have:

- **Frontend:** React + Tailwind app (Home, Basket, Deliveries).
  - **Backend:** Azure Functions Python API (listings, basket, orders, deliveries).
  - **Database:** SQL Server with all tables (listing, basket\_item, order, delivery, etc.).
- 

## 🎯 Next optional steps

You can now choose what to add next:

1. 🧠 **Authentication** – add Azure AD B2C login for buyers & deliverers.
2. 🖼️ **Image uploads** – store item photos in Azure Blob.
3. 📱 **PWA support** – make it installable like a mobile app.
4. ☁️ **Deploy** – push both frontend & backend to Azure (Free tier).

Which one would you like to start next?
