✅ Super quick guide to test the frontend:

1. **Make sure backend is running**
   In one terminal:

   ```
   cd C:\Users\Selim Rawefi\My_Projects\KidToKid\apps\api
   .venv\Scripts\activate
   func start
   ```

   → confirm it shows your `/api/listings` route.

2. **Start the frontend**
   Open a **new terminal tab** in VS Code:

   ```
   cd C:\Users\Selim Rawefi\My_Projects\KidToKid\web
   npm run dev
   ```

   → open the shown URL (usually `http://localhost:5173`).

3. **Test in browser**

   o You should see your home page listing items from the database.

   o Click **"Add to Basket"** → adds item (test via Postman `/basket` if needed).

   o Click **"♥ Favorite"** → adds favorite.

   o Switch to Basket tab (or page) → confirm items appear.

   o Confirm purchase → basket clears.

✅ That's your full frontend–backend flow working locally.
